Description

ATR62007 is an ultra-thin micro-fiber spectrometer developed by Optosky. It uses high-sensitivity linear CMOS. Optosky specially customized an ultra-low-noise CMOS signal processing circuit, thereby greatly reducing the noise of the sensor and achieving an excellent signal-to-noise ratio (ratio (approximately 2 times higher than similar competitors), and the measurement reliability of ATR62007 has been improved. The measurement results do not change with the ambient temperature, which is the best level in the industry.

ATR62007 can receive SMA905 optical fiber input light or free space light, and output the measured spectral data through USB2.0 or UART port.

ATR62007 only requires a 5V DC power supply or USB power supply, which is very easy to integrate and use.

ATR62007 is very suitable as a spectroscopic module for a handheld Raman spectrometer. As the most professional Raman spectrometer manufacturer, Optosky has written high-performance Raman software for ATR62007, making it very suitable for Raman spectrometer applications.
