

VIS-NIR Hyperspectral Camera

ATH1010-4-25

Feature:

- Spectral Range: 380 ~ 2500 nm
- Max Spatial Channels : 2048
- Max Spectral Channels : 1200
- Max FOV: 21.7°(Depending on the lens)
- Superior imaging performance
- Data format is compatible with ENVI;
- Dimensions: 372mm × 276mm × 185mm;
- Light weight: 4.56kg;
- No mechanical scanning, high reliability;

Application:

- Prospecting for geology and minerals;
- Agriculture Monitoring: Crop condition and yield assessment
- Forest pest and fire prevention monitoring;
- Coastline and ocean monitoring;
- Pasture monitoring;
- Lake and watershed monitoring;
- Remote sensing teaching and research ;
- Industrial sorting;
- Ecological environment protection and mine monitoring;
- Water quality and soil monitoring;

Describe:

ATH1010-4-25 is a new and optimized shortwave infrared hyperspectral imaging system with small size and light weight. The spectral range is 400 ~ 2500nm. Except, ATH1010-4-25 has high spatial resolution, high spectral resolution, wide imaging range, etc. And it consists of two parts: imaging lens and hyperspectral camera.

ATH1010-4-25 uses high-performance Te-cooled CCD imaging device with 2048 x 1200 pixels and 640 x 512 pixels, which makes it has clear image, less noise and good linearity.

With its temperature-stable optical system, ATH1010-4-25 provides excellent stability and sensitivity required in VIS-NIR infrared chemical imaging applications, and meets the stringent requirements of laboratory, field, and industrial applications, making it become the right-hand in applications such as drug quality inspection, food safety, and agricultural analysis.

1. Selection Guide

ATH1010 Series Model	Feature	Application
ATH1010	380-1000nm VIS-NIR Hyperspectral Camera	Precision agriculture, agroforestry diseases and insect pests, vegetation analysis, planting area assessment, crop yield assessment, water quality analysis, art scanning, cultural relic identification, pattern scanning, industrial sorting, oil pollution detection, etc
ATH1010-17	1.0~1.7μm SWIR Hyperspectral Camera	Semiconductor, industrial sorting, food sorting, construction waste sorting, meat sorting, plastic sorting, geological exploration, mineral exploration, cultural relics identification, judicial identification, document inspection
ATH1010-25	1.2~2.5μm SWIR Hyperspectral Camera	Precision agriculture and food analysis, dark plastic sorting, geological exploration, mineral exploration, national defense industry, cultural relic identification, judicial identification, document inspection, water content analysis, drug and material sorting, mineral mapping, medical identification, waste recycling;
ATH1010-4-25	0.38~2.5μm VIS-NIR Hyperspectral Camera	Geological survey, national defense industry, gas analysis, VOCs inspection, water temperature detection, land cover type identification, camouflage investigation, mineral sorting,
ATH1010-04-17	0.38~1.7μm VIS-NIR Hyperspectral Camera	Precision agriculture, agroforestry diseases and insect pests, vegetation analysis, planting area assessment, crop yield assessment, water quality analysis, art scanning, cultural relic identification, pattern scanning, industrial sorting, oil pollution detection, etc

2. Performance Parameter

ITEM	PARAMETER	
Spectral Range	380 ~ 2500 nm	
	VNIR	SWIR
Sensor Type	High Sensitivity VNIR detector	Te-cooled InGaAs I and InGaAs II SWIR Detector
Resolution	1.3 nm	8-15 nm
Image Resolution	2048 × 1088	640 X 512
Raw Pixels Size	5.5 μm x 5.5 μm	15 μm x 15 μm
Bit Depth	12bits	16bits
Max Spatial Channels	1200	512
Max Spectral Channels	2048	2048
Frame Rate	240 fps	240 fps
Interface	USB3.0	
Power Supply	12V±10%, 70W	
FOV	15.2°@f=35mm	
IFOV	0.7mrad@f=35mm	
Size	372mm × 276mm × 185mm	
Weight	<4.56kg	
Working Temp.	-20 - 50°C	
Storage Temp.	-30-70°C

6.1 Industrial Sorting Application

Product data information is current as of publication data. Products conform to specifications per the terms of Optosky Standard warranty.

With the development of NIR hyperspectral technology, such as Jiang tried to use near-infrared hyperspectral technology to detect impurities in cotton, especially the application of SWIR hyperspectral technology, which significantly improved the detection rate of plastic films compared with conventional methods.

Hyperspectral imaging technology is based on a very large number of narrow-band image data technology, which can obtain image information and spectral information of the sample while imaging the sample. Commonly used hyperspectral data processing methods include partial least squares (PLS), support vector machine (SVM) and artificial neural network (ANN).

Apple's external quality is the most intuitive quality feature of Apple, which directly affects Apple's price and consumer preference. Aiming at the difficulties and key points of external inspection of apples, based on machine vision technology, hyperspectral imaging technology and multispectral imaging technology, integrated image processing technology, pattern recognition method, chemometric method and spectral analysis technology, the external physical quality of apple (shape and size) and detection methods for common defects on the surface.

The detection system and algorithm developed on the basis of the above research laid the foundation for my country's research and development of rapid online inspection and grading equipment

for Apple's external quality based on machine vision technology and multi-spectral machine vision technology.

Figure 17 Green plants measured spectrum

- 1) **Crop growth monitoring and yield estimation:** Due to the different external factors of crops at each stage of their growth and development, there will be certain differences in their internal composition and external morphology. The most important difference is the leaf area index. Leaf area index is a comprehensive index reflecting the individual characteristics and group characteristics of crops.
- 2) **Crop pest control:** Remote sensing technology can monitor the effects of pests and diseases on the growth and development of crops, track the growth and development of crops, analyze and estimate disaster losses, and can monitor the distribution and activity of pests, thereby preventing the occurrence of pests.
- 3) **Drought monitoring of crops:** Remote sensing technology monitors crop drought conditions through crop vegetation index and canopy parameters.
- 4) **Monitoring of soil moisture content and distribution:** In the case of different thermal inertia

conditions, the difference between remote sensing spectra is very obvious, so a mathematical model between thermal inertia and soil moisture content can be established, and remote sensing technology uses this model to analyze soil moisture content and distribution.

- 5) **Crop nutrient monitoring:** The accuracy of remote sensing technology to monitor the nitrogen content of crops is higher than that of other nutrient elements.

Normalized difference spectral index (NDSI), ratio spectral index (RSI) and simple spectral index (SSI) were constructed by using single band and any two bands in the range of 450 ~ 882 nm to calculate the correlation between CGI and spectral index and screen out spectral index with good correlation. Combined with partial least squares regression (PLSR), the inversion model was established.

Using CGI as the index, Airborne hyperspectral image was used to monitor the growth status of wheat in the multi-growth period in 2015. Unmanned aerial vehicle hyperspectral image inversion CGI has high precision, which can judge the difference of wheat overall growth, and can provide reference for wheat growth monitoring.

Figure 18 CGI inversion of wheat growth index

6.3 Forest Health Application

Used for pest monitoring and forest resource assessment.

Principle: The health of vegetation is related to greenness index, leaf area index, leaf moisture content and light use efficiency;

Figure 20 Distribution map of masson pine health degree studied by Wang Shuang of the University of Electronic Science and Technology of China with a hyperspectral camera

6.4 Geological Prospecting Application

Spectral remote sensing technology evolved from the multi-spectral remote sensing technology represented by Landsat and took initial shape in the mid-1980s (Goets et al., 1985, Tong Qingxi et al., 2006).

Due to its advantages of high spectral resolution and atlas integration, hyperspectral remote sensing technology has the ability of fine detection and analysis of surface rock mineral composition on a large scale. It can not only provide a macro image of the ground, but also determine the type and abundance of minerals in the geological body, and even the chemical composition of some minerals at pixel level details (Wang Runsheng et al., 2010).

In recent years, with the continuous development of hardware, data processing methods and software related to imaging spectrometer, the application of hyperspectral remote sensing technology in the field of geological survey has been accelerated.

Hyperspectral remote sensing technology has played an important role in geological mapping, the definition and division of hydrothermal alteration zones, and the delineation and discrimination of

mineralization anomalies from large metallogenic areas to medium-scale ore fields (e.g. Bierwirth et al., 2002; Company Changyun et al., 2005; Kruse et al., 2006; Cudahy et al., 2007; Wang Runsheng et al., 2010; Liu Dechang et al., 2011; Yan Baikun et al., 2014; Yang Zian et al., 2015; Graham et al., 2017).

With the theory of metallogenic system (Wyborn et al., 1994) becoming the guiding principle of prospecting practice, thematic mineral mapping on the scale of large ore concentration areas and metallogenic belts will provide key regional material composition information for predictive prospecting and exploration.

The spectral wavelength ranges used for mineral mapping include visible light (400-700nm), NIR (700-1000nm), SWIR (1000-2500nm), and thermal IR (7000-15000nm). At present, the most widely used in mining is the short-wave infrared region (1000-2500nm).

Because the frequency is close to the cofrequency and combined frequency of the chemical bond vibration in the mineral lattice, the mineral containing water or OH- (mainly layered silicate and clay) as well as some sulfate and carbonate minerals can be observed in the range of short-wave infrared wavelength.

Soil salinization is one of the important ecological and environmental problems in arid and semi-arid areas. Soil salinization causes soil hardening, fertility decline, acid-base imbalance, land degradation and other consequences, which seriously restricts agricultural development in China and affects the strategic situation of sustainable development in China at present. Remote sensing technology, with its characteristics of large scale, wide range, strong timeliness and economy, makes up for the deficiency of traditional methods for monitoring salinization phenomenon, and provides a new way for quantitative monitoring of soil salinization phenomenon.

Fig. 34 (a) Spatial distribution of total phosphorus concentration in Taihu Lake. The spatial difference of total phosphorus concentration was obvious, with the highest value of 0.38mg/L and the lowest value of 0.06mg/L. (b) Monthly variation of total phosphorus concentration in different lakes.

The lake area also generally reaches its maximum phosphorus concentration between June and September. The total phosphorus concentration in Zhushan Bay, Meiliang Bay and the west bank of Taihu Lake was higher than the mean value of the whole lake from March to October of the year, and was significantly higher than that in the rest of Taihu Lake. The total phosphorus concentration in Gonghu Bay was higher than that in the whole lake only in June, and the total phosphorus concentration in the south bank of Taihu Lake and Great Taihu Lake was relatively low throughout the year.

7. Company Profile

Optosky company is a first-class spectroscopy solution provider, with the headquarter locates in the 7th floor of the research institute of the Chinese Academic of Science at an area of 2500 square meter in Xiamen city where successfully held the international 9th BRICK summit in 2017. The subsidiary company locates in Wuhu city with an area of 2035 square meters.

The company founder Dr. Hongfei Liu graduated Doctor degree from the Chinese Academic of Science and postdoctoral degree from Xiamen University, by integrating both of top Universities' spectroscopy technology background into Optosky company aiming at developing the leading spectroscopy equipment in the world.

The company bases on unique technologies of Optomechatronics, Spectroscopy Analysis, Process Weak Optical and Electrical Signals, Cloud Computing, and have been developed wide products line of the competitive Raman spectroscopy instruments, micro spectrometer, hyperspectral imager, field spectroradiometer, fluorescence spectroscopy, LIBS etc. Driven by advanced technologies and products, Optosky brand has been well-known to customers all over the world.

Optosky company base on technology innovation, market-driven direction, customer first, provides first-class products and services, and one-stop solutions to many fortune 500 companies in many industries. The company received praise from different industry companies, as well as many innovative intellectual properties, software copyright, qualification certification, and winner awards over hundred numbers.

Optosky receives top class A introduced the high-tech company to international Xiamen city, the national high-tech and new innovative technology company award. The founder Dr. Hongfei Liu receives the innovation talent award by the ministry of science and technology.

The company is currently conducting the exclusive project of major industrialization national oceanic administration with a total fund of five million us dollars. The company in charge of drafting national industry standard of VNIR and SWNIR Field Spectroradiometer, and six national standard drafters, including China National Standard Drafter for Hazmat detector based on Raman spectroscopy, China National Standard Drafter for Buoy-type Monitor eco-environment, China National Standard Drafter for water quality monitor in the unmanned boat, China National Standards drafter for online water quality monitor by spectroscopy, China National Standard Drafter for UV-absorbent measure fabrics.

The company has over 70 IPs and over 20 innovative patents.

The company received ISO9001:2015 certification, CE certification, Police Administration Certification, FDA approval compliant, IQOQPQ compliant.
