DESCRIPTION:

The 5V551 clock driver is built using advanced CMOS technology. This low skew clock driver offers 1:4 fanout. The fanout from a single input reduces loading on the preceding driver and provides an efficient clock distribution network. The 5V551 offers low capacitance inputs. Typical applications are clock and signal distribution.

ABSOLUTE MAXIMUM RATINGS(1)

Symbol	Description	Max.	Unit
V_{DD}	Supply Voltage	–0.5 to +4.6	V
V_{TERM}	All Inputs	–0.5 to +7	V
	All Outputs	–0.5 to V_{DD} + 0.5	
T_A	Ambient Operating Temp	–40 to +85	°C
T_{STG}	Storage Temperature	–65 to +150	°C
T_J	Junction Temperature	150	°C
T_{SOLDER}	Soldering Temperature	260	°C

NOTE:
1. Stresses greater than those listed under ABSOLUTE MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

PIN DESCRIPTION

Name	Type	Description
ICLK	Input	Clock Input, internal pull-up resistor
Qn	Output	Clock Outputs
GND	PWR	Connect to Ground
V_{DD}	PWR	Connect to 3.3V
OE	Input	Output Enable. Tri-states outputs when LOW. Internal pull-up resistor.

EXTERNAL COMPONENTS

A minimum number of external components are required for proper operation. A decoupling capacitor of 0.01µF should be connected between V_{DD} on pin 7 and GND on pin 6, as close to the device as possible. A 33Ω series terminating resistor may be used on each clock output if the trace is longer than one inch.
